

Week 3 - Lecture 1 Arrays

Edited by: Heshan Du Autumn 2023

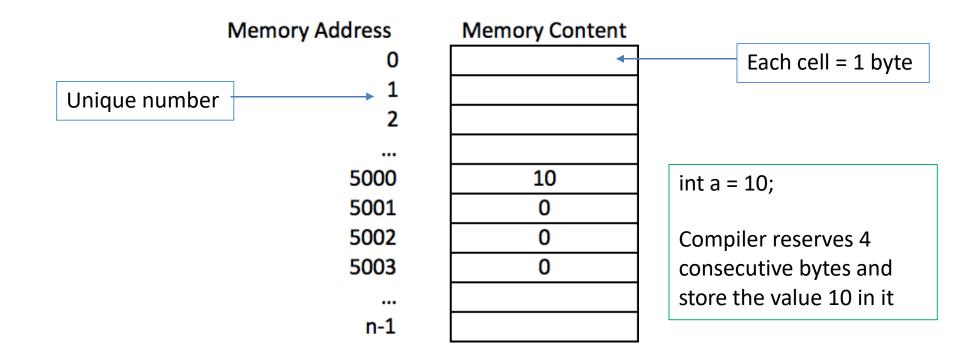

Overview

- One-dimensional array
- Two-dimensional array
- String or char array

Memory Layout

Array Memory Layout

An array is a *continuous* block of memory to store values of the *same type*.

Memory Address	Memory Content				
0					
1					
2					
5000	10				
5001	0				
5002	0				
5003	0				
n-1					

Declaring an Array

data_type array_name[number_of_elements];

#define SIZE 10 Values are stored in consecutive memory locations. arr take 40 bytes (10 integer elements, 4 bytes each).

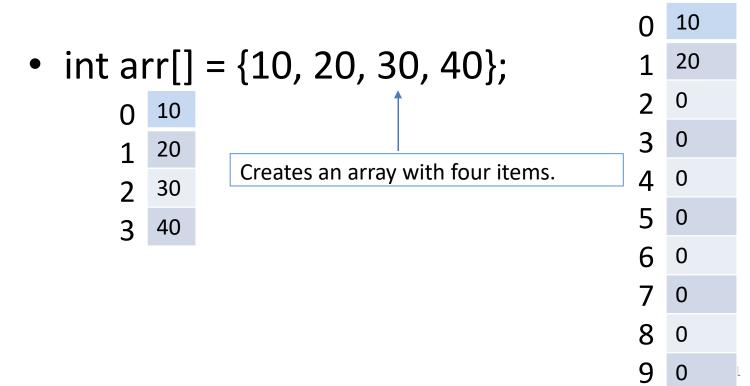

- Avoid useless waste of memory, declare an array with the length that is needed
- Access an array element e.g., arr[0], ...,
 arr[9]

Array Initialisation

- int arr[4] = $\{10, 20, 30, 40\}$;
- int arr[10] = {10, 20};

The values of arr[0] and arr[1] become 10 and 20, respectively, the rest of the elements are set to zero.

Assigning Values

char arr[4] = {'\0'};arr[4] = 'a';

'\0' is null character and is used to end a string

Array out of bound, but the compiler won't tell you!!!

char and int in C

Dec	Н	Oct	Cha	r	Dec	Нх	Oct	Html	Chr	Dec	Нх	Oct	Html	Chr	Dec	Нх	Oct	Html Ch	<u>ır</u>

char Type

 A character in the ASCII set is represented by an integer between 0 and 127

Char = B and its ASCII code is 66

Array Out of Bound

C does **NOT** check if the array index you try to access is valid!

Output:

std[0]: 100 std[1]: 200 std[2]: 300 std[3]: 400 std[4]: 2314

```
#include<stdio.h>
int main(void){
 int std[4];
 int i;
 std[0] = 100; //valid
 std[1] = 200; //valid
 std[2] = 300; //valid
 std[3] = 400; //valid
 std[4] = 500; //invalid(out of bounds index)
 //printing all elements
 for( i=0; i<5; i++ )
   printf("std[%d]: %d\n",i,std[i]);
 return 0;
```

Array Out of Bound

```
0 100
1 200
2 300
3 400
4 X
```

```
Output:

std[0]: 100

std[1]: 200

std[2]: 300

std[3]: 400

std[4]: 2314
```

```
#include<stdio.h>
int main(void){
 int std[4];
 int i;
 std[0] = 100; //valid
 std[1] = 200; //valid
 std[2] = 300; //valid
 std[3] = 400; //valid
 std[4] = 500; //invalid(out of bounds index)
 //printing all elements
 for( i=0; i<5; i++ )
   printf("std[%d]: %d\n",i,std[i]);
 return 0;
```

Overview

- One-dimensional array
- Two-dimensional array
- String or char array

Two-Dimensional Array

• Stored as "flat" continuous memory.

```
133
           int water[7][24] = \{0\};
134
135
           int time = 0;
136
           int day = 0;
137
            int sum = 0;
                                                                    otal number of glasses: 21
138
139
           do
140
141
                printf ("Please enter the day and time you have some water: ");
                scanf("%d%d", &day, &time);
142
143
144
                if ((time < 0) || (time >= 24) || (day < 0) || (day >= 7))
145
146
                     break;
147
148
149
                printf("Please enter the amount of water: ");
150
                scanf("%d", &water[day][time]);
151
                sum = sum + water[day][time];
152
153
            \{\text{while}((\text{time} >= 0) \&\& (\text{time} < 24) \&\& (\text{day} >= 0) \&\& (\text{day} < 7))\};
```

Two-Dimensional Array

 data_type array_name [number_of_rows][number_of_columns];

• The elements are stored in row order with the elements of row 0 first, followed by the elements of row 1, and so on.

2D Array Initialisation

- int arr[3][3] = {{10, 20, 30},{40, 50, 60},{70, 80, 90}};
- int arr[3][3] = {10, 20, 30, 40, 50, 60, 70, 80, 90};
- int arr[3][3] = $\{\{10, 20\}, \{40, 50\}, \{70\}\};$

Remaining elements are set to zero.

• int arr[][3] = $\{10, 20, 30, 40, 50, 60\}$;

Same as arr[2][3];

Overview

- One-dimensional array
- Two-dimensional array
- String or char array

Array: Char to String

A string such as "hello" is really an array of individual characters in C.

For example,

char array1[] = "first";

initializes the elements of array array1 to the individual characters in the string literal "first".

The preceding definition is equivalent to char array1[] = { 'f', 'i', 'r', 's', 't', '\0' };

String

ASCII code for '\0' is 0 ASCII code for 0 is 48!!

- A series of characters that end with a special character, the null character, '\0'
- e.g., "message" requires 8 bytes (7 character
 + null character)
- char str[8];

Could get unpredicted results if no space for '\0'

- char str[8] = "message";
- char str[] = "message";
- char str[] = {'m', 'e', 's', 's', 'a', 'g', 'e', '\0'};

Writing Strings: examples

```
char str[10];
str[0] = 'a';
printf("%s\n", str);
```

```
char str[10] = {0};
str[0] = 'a';
printf("%s\n", str);
```

```
char str[10];

str[0] = 'a';

str[1] = '\0';

printf("%s\n", str);
```

printf and '\0'

printf prints until null character.

```
#include <stdio.h>
283
284
285
      int main (void)
286
     ∃{
          char myString3[10] = "!\0!\0!\0!\0!";
287
          char myString2[10] = "Hey There\0";
288
          char myString[10] = "!!!!!!!!";
289
290
291
292
          printf("%s\n", myString3);
          printf("%s\n", myString2);
293
          printf("%s\n", myString);
294
```

```
C:\Users\z2017233\Desktop>array
!
Hey There
!!!!!!!!
```

Read Strings

- scanf() reads characters until it encounters a space character i.e., space, tab or new line character
- Then appends a null character at the end of the string

Read Strings (2)

```
#include <stdio.h>
int main()
{
    char name[20];
    printf("Enter name: ");
    scanf("%s", name);
    printf("Your name is %s.", name);
    return 0;
}
```

Output:

Enter name: Dennis Ritchie

Your name is Dennis.

Read Strings(3)

fgets() function reads a line of string, puts() displays the string.

```
#include <stdio.h>
int main()
{
    char name[30];
    printf("Enter name: ");
    fgets(name, sizeof(name), stdin); // read string
    printf("Name: ");
    puts(name); // display string
    return 0;
}
Output:
```

Enter name: Tom Hanks

Name: Tom Hanks

getchar() function

... and we are back on input buffer again!!!

```
#include <stdio.h>
int main () {
 char c;
 printf("Enter character: ");
 c = getchar();
 printf("Character entered: ");
  putchar(c);
 return(0);
```

getchar vs. scanf

- scanf is a formatted of reading input from the keyboard.
- getchar reads a single character from the keyboard.

scanf VERSUS getchar

scanf getchar C function to read input C function to read a from the standard input character only from the until encountering a standard input whitespace, newline or stream(stdin) which is the EOF keyboard scanf function takes the getchar function does not format string and variables take any parameters with their addresses as parameters getchar reads a single scanf reads data according character from the to the format specifier keyboard Visit www.PEDIAA.com

Source: https://pediaa.com/what-is-the-difference-between-scanf-and-getchar/

Example: calculate average

```
#include <stdio.h>
                                                                           45
int main()
                                                                           35
  int marks[10], i, n, sum = 0, average;
                                                                           38
  printf("Enter number of elements: ");
                                                                           31
  scanf("%d", &n);
                                                                           49
  for(i=0; i<n; i++)
     printf("Enter number%d: ",i+1);
     scanf("%d", &marks[i]);
                                                                       6
     // adding integers entered by the user to the sum variable
     sum += marks[i];
                                                                       8
                                                                       9
  average = sum/n;
  printf("Average = %d", average);
  return 0;
```

Output:

Enter n: 5

Enter number1: 45

Enter number 2: 35

Enter number3: 38

Enter number4: 31

Enter number5: 49

Average = 39

Summary

- One-dimensional array
- Two-dimensional array
- String or char array
